# 1. Summary of test results

The test results apply exclusively to the test samples as presented in this Report. The CETECOM GmbH does not assume responsibility for any conclusions and generalizations taken in conjunction with other specimens or samples of the type of the item presented to tests. Also we refer on special conditions which the applicant should fulfill according §2.927 to §2.948, special focus regarding modification of the equipment and availability of sample equipment for market surveillance tests.

The <u>Equipment Under Test</u> (in this report, hereinafter referred as EUT) is a digital device with no support of radiofrequency technologies. A typical operating mode (one or more) as used in the real usage was tested or a special test program simulating this was used. Pls. see chapter Operating-Mode for more details.

Following tests have been performed to show compliance with applicable standards as shown in table below:

## 4. Description of test system set-up's

### 4.1. Test system set-up for radiated electric field measurement 30 MHz to 1 GHz

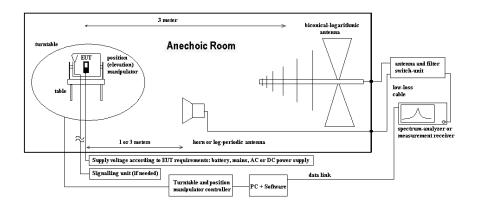

ANSI C63.4-2014 chapter 8.2.3, ANSI C63.10-2013 chapter 6.5 **Specification:** 

**General Description:** Evaluating the field emissions have to be done first by an exploratory emissions

measurement and a final measurement for most critical frequencies. The tests are performed in a NSA-compliant semi anechoic room (SAR) recognized by the

regulatory commissions.

**Schematic:** 

#### **Testing method:**

Formula:

#### **Exploratory, preliminary measurements**

The EUT and its associated accessories are placed on a non-conductive position manipulator (tipping device) of 0.8 m height which is placed on the turntable. By rotating the turntable (range 0° to 360°, step 90°) and the EUT itself either on 3orthogonal axis (portable equipment) or 2orthogonal axis (defined operational position of EUT) the emission spectrum and it's characteristics was recorded with an EMIreceiver, broadband antenna and software.

Measurement antenna: horizontal and vertical, heights: 1,0 m and 1,82 m as worst-case determined by an exploratory emission measurements. The results are documented in a diagram. Critical frequencies (low margin to limit) are saved within a table for further investigations. If various operating modes are supported, further investigations are made to find the worst-case of them. Also the interconnection cables and equipment position were varied in order to maximize the emissions.

 $E_C = E_R + AF + C_L + D_F - G_A$  (1)

 $M = L_T - E_C$ (2) Final measurement on critical frequencies

Based on the exploratory measurements, the most critical frequencies are re-measured by maintaining the EUT's worst-case operation mode, cable position, etc. either on 10m OATS or 3m semianechoic room.

First a frequency zoom around the critical frequency is done to locate the frequency more precisely. After this step, for all identified critical frequencies, the maximum peak was determined.

Following parameters were varied: the turntable angle continuously in the range 0 to 360 degree, the EUT itself either over 3-orthogonal axis (not defined usage position) or 2-orthogonal axis (defined usage position). The measurement antenna height between 1 m and 4 m.

On the determined worst-case position, a final measurement with necessary bandwidth and detector according standard has been carried out.

AF = Antenna factor

 $C_L$  = Cable loss

 $D_F$  = Distance correction factor (if used)

 $E_C$  = Electrical field – corrected value

 $E_R$  = Receiver reading

 $G_A$  = Gain of pre-amplifier (if used)

 $L_T = Limit$ 

M = Margin

All units are dB-units, positive margin means value is below limit.

#### **5.1.4. MEASUREMENT RESULTS**

The results are presented below in summary form only. For more information please consult the diagrams included in annex 1.

Dia- gram no.	Frequency range	Set- up no.	OP- mode no.	Remark	Used	detec	ctor	Result
110.		110.	110.		PK	AV	QP	
3.01	30 MHz – 1 GHz	1	1	EUT position standing	×		X	passed
3.02	30 MHz – 1 GHz	1	1	EUT position laying	×		X	passed

Remark: see diagrams in annex 1 for more details

#### 5.2. Measurement uncertainties

The reported uncertainties are calculated based on the standard uncertainty multiplied with the appropriate coverage factor  $\mathbf{k}$ , such that a confidence level of approximately 95% is achieved.

For uncertainty determination, each component used in the concrete measurement set-up was taken in account and it's contribution to the overall uncertainty according it's statistical distribution calculated.

Following table shows expectable uncertainties for each measurement type performed.

RF-Measurement	Reference	Frequency range	Ca	Calculated uncertainty based on a confidence level of 95%					Remarks

## 8.1.3. Legend

Note / remarks		Calibrated during system calibration:
	1a	System CTC-SAR-EMS (RefNo. 442)
	1b	System-CTC-EMS-Conducted (RefNo. 335)
	1c	System CTC-FAR-EMI-RSE (RefNo . 443)
	1d	System CTC-SAR-EMI (RefNo . 441)
	1e	System CTC-OATS (EMI radiated) (RefNo. 337)
	1 f	System CTC-CTIA-OTA (RefNo . 420)
	1 g	System CTC-FAR-EMS (RefNo . 444)
	2	Calibration or equipment check immediately before measurement
	3	Regulatory maintained equipment for functional check or support purpose
	4	Ancillary equipment without calibration e.g. mechanical equipment or monitoring equipment
	5	Test System
Interval of calibration	12 M	12 month
	24 M	24 month
	36 M	36 month
	24/12 M	Calibration every 24 months, between this every 12 months internal validation
	36/12 M	Calibration every 36 months, between this every 12 months internal validation
	Pre-m	Check before starting the measurement

# 9. Versions of test reports (change history)

Without calibration
